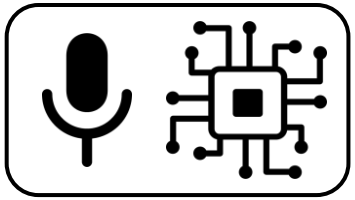
Computational Analysis of Sound and Music

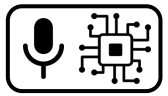


Music Information Retrieval – Rhythmic Analysis

Dr.-Ing. Jakob Abeßer

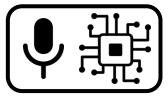
Fraunhofer IDMT

jakob.abesser@idmt.fraunhofer.de



Outline

- **Introduction**
- Traditional Methods
- DL-based Methods



Tempo Detection

Introduction

- Tempo [beats / minute]
  - Frequency with which humans tap along the beat

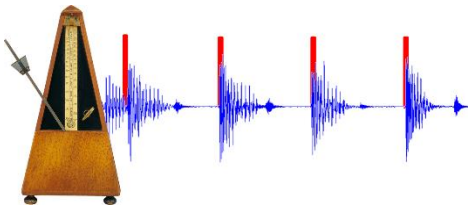


Fig-M1-1

Easy

Aud-M1-1

Harder

Aud-M1-2

- Beat tracking
  - Estimating precise beat positions

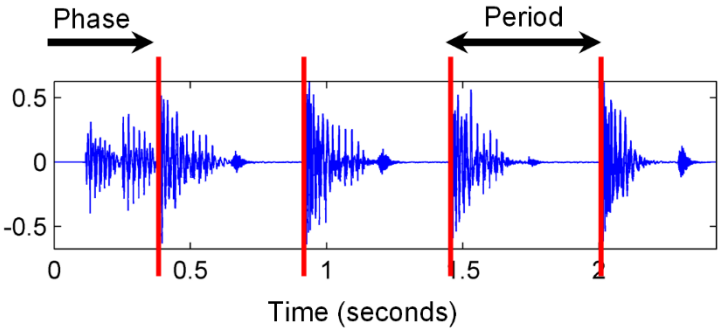

Fig-M1-2

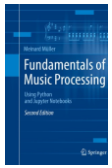
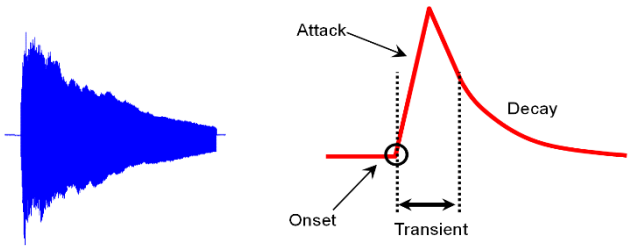


FMP Notebooks

Tempo Detection

Introduction

- Note onsets → note beginning times
  - Clearly defined for plucked string and percussion instruments
  - Ambiguous for wind & brass instruments
- Onset detection
  - Onset detection function
  - Peak picking



Audio samples → Note envelope

Fig-M1-3

Onset detection function & peaks

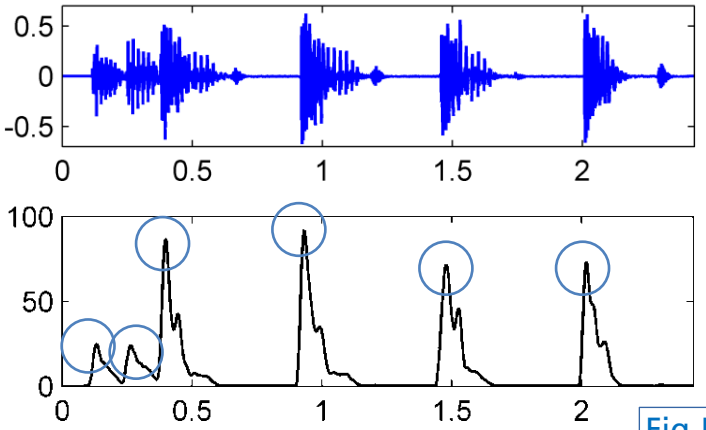

Fig-M1-4

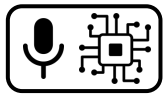
Outline

- Introduction
- **Traditional Methods**
- DL-based Methods



Tempo Detection

Traditional Method

- Predominant local pulse (PLP)
  - Correlation with local (windowed) periodic patterns
- Tempogram [Grosche & Müller, 2011]
  - Local likelihood of different tempo candidates
  - Allows to follow tempo changes (e.g., classical music)

FMP Notebooks

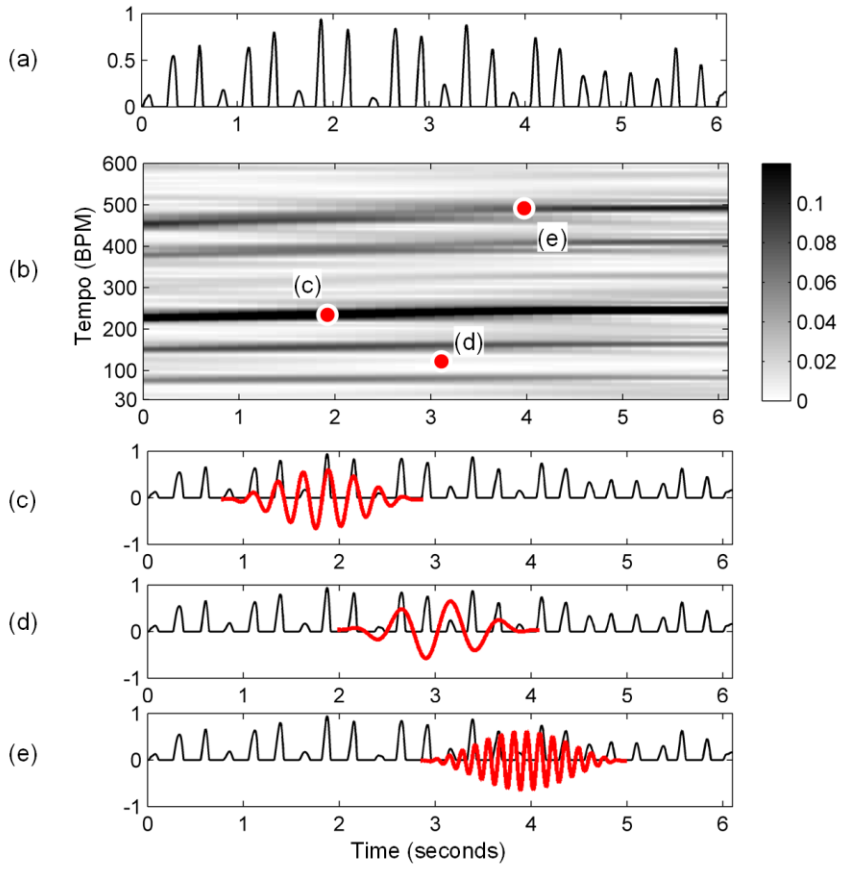


Fig-M1-5

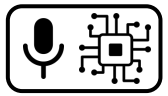
Outline

- Introduction
- Traditional Methods
- **DL-based Methods**



Tempo Detection

DL-based Method

- Approach [Böck et al., 2015]

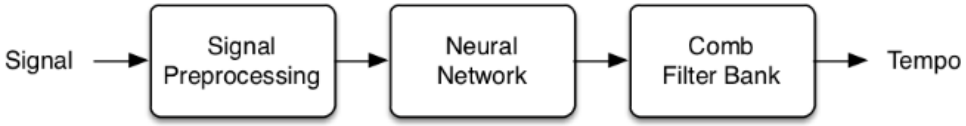


Fig-M1-6

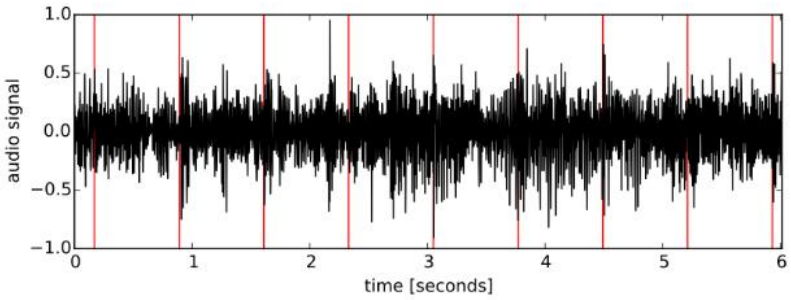
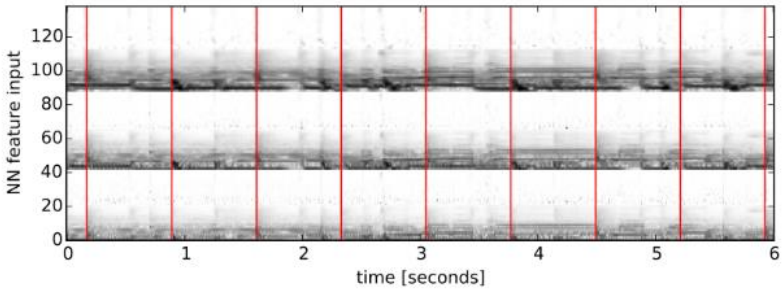


(a) Input audio signal

- Signal representation
  - Stacking of 3 STFT magnitude spectrograms (N=1024, 2048, 4096)
  - Log-amplitude & log-frequency



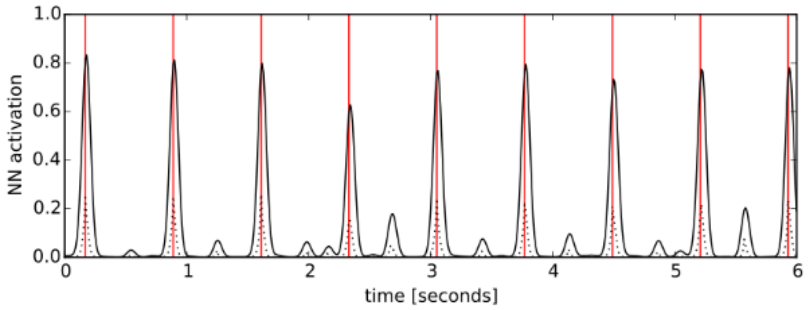
(b) Input to the neural network

Fig-M1-7

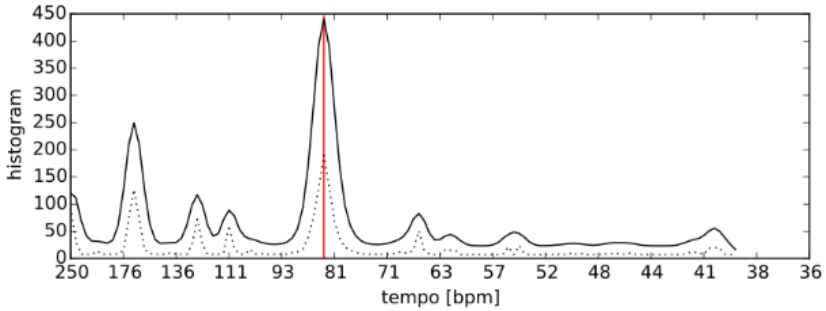
Tempo Detection

DL-based Method

- Neural Network
  - Recurrent (bi-directional LSTM) layer
  - Outputs beat activation function
- Comb filter bank
  - Multiple comb filters → detect periodicities
- Estimate tempo from histogram maximum



(c) Neural network output (beat activation function)



(f) Weighted histogram with summed maxima

Fig-M1-8

Tempo Detection

DL-based Method

- Approach [Schreiber & Müller, 2018]
  - Sample rate ~ 11 kHz, 40-band mel spectrogram
- Main contributions
  - End-to-end tempo without intermediate novelty function
  - 4 multi-filter modules → compress along frequency & find periodicities
  - Dense layers → tempo classification
    - 256 classes: 30 – 285 bpm

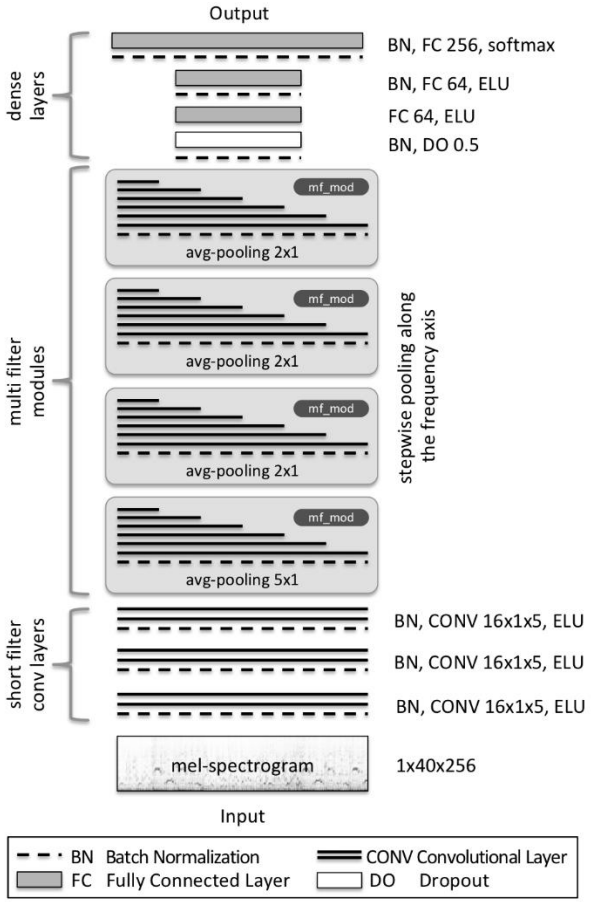


Fig-M1-9

Tempo Detection

DL-based Method

- Temporal Convolutional Networks (TCN) [Davies & Böck, 2019]
  - Use dilated convolution for larger temporal context

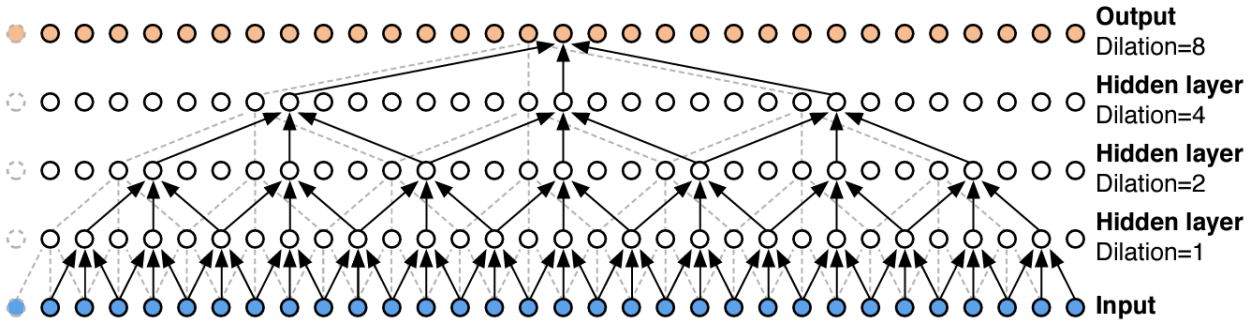

Fig-M1-10

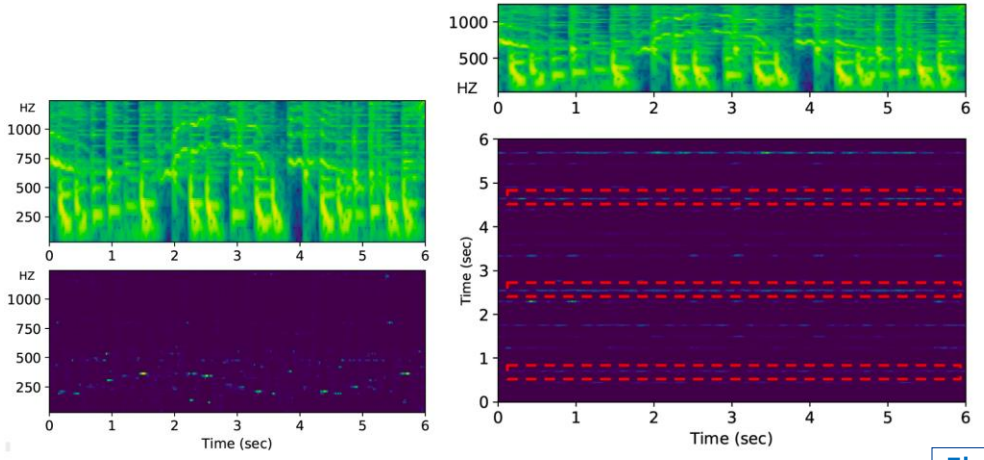
Tempo Detection

DL-based Method

- Transformer Networks [Hung et al., 2022]
  - Joint beat & downbeat tracking
  - Combine TCN & Spectral-Temporal Transformer in Transformer (SpecTNT)
  - Separate encoder allow for separate spectral attention (timbre) & temporal attention (beat / downbeat positions)



(a) Spectral attention (b) Temporal attention
